

❖ Carboranes

Carboranes are the cluster composed of carbon, boron and hydrogen atoms; and just like boranes, can be classified as closo-, nido-, arachno-, hypho-, or -klado based on whether they represent a complete (closo) polyhedron, or a polyhedron that is missing one (nido-), two (arachno-), or more vertices. Carboranes are the most common examples of heteroboranes. The electronic structure of carboranes has been described by Wade-Mingos rules. Three main categories of carboranes are discussed below.

➤ Closo-(Closed) Carboranes

These are closed triangular polyhedral structures in which all the vertices of the triangular polyhedral geometries are occupied mainly by boron and some sites by carbon atoms. There are $n+1$ electron pairs (or $4n+2$ skeletal electrons) involved in multicentre bonding in closo-carborane; where n represents the total number of B and C atoms. Some of the common examples of closo-carboranes are:

1. $C_2B_{10}H_{12}$: In $C_2B_{10}H_{12}$, $n = 12$; according to Wade's rule, the two CH units contribute $2 \times 3 = 6$ electrons and ten BH units contribute $10 \times 2 = 20$ electrons to the bonding molecular orbitals or to the skeletal structure. Thus, there are 13 electron pairs ($n+1 = 13$) present in the multicentre bonding orbitals of $C_2B_{10}H_{12}$, confirming this as a closo kind. Three isomers (ortho-, meta- and para-) are possible.

Figure 19. Structure and isomerism in $C_2B_{10}H_{12}$ (dicarba-closo-dodecaborane).

Any act of copying (including plagiarizing its language) or sharing this document will result in severe civil and criminal prosecution to the maximum extent possible under law.

2. $C_2B_3H_5$: In $C_2B_3H_5$, $n = 5$; according to Wade's rule, the two CH units contribute $2 \times 3 = 6$ electrons and three BH units contribute $3 \times 2 = 6$ electrons to the bonding molecular orbitals or the skeletal structure. Thus there are 6 electron pairs ($n+1 = 6$) present in the multicentre bonding orbitals of $C_2B_3H_5$, confirming this as closo kind. Three isomers are possible which are given below.

Figure 20. Structure and isomerism in $C_2B_3H_5$.

➤ **Nido-(Nestlike) Carboranes**

These are nest-like geometries and can be assumed as the derivatives of closed triangular polyhedral structures in which one vertex is removed. Most of the sites in these clusters are occupied by boron atoms while some sites by carbons. There are $n+2$ electron pairs (or $4n+4$ skeletal electrons) involved in multicentre bonding in nido-carboranes; where n represents the total number of B and C atoms. Common examples are:

1. $C_2B_9H_{13}$: In $C_2B_9H_{13}$, $n = 11$; and according to Wade's rule, the two CH units contribute $2 \times 3 = 6$ electrons, nine BH units contribute $9 \times 2 = 18$ electrons, and two additional hydrogens contribute $2 \times 1 = 2$ electrons to the bonding molecular orbitals or the skeletal structure. Thus there are total 26 electrons or 13 electron pairs ($n+2 = 13$) present in the multicentre bonding orbitals of $C_2B_9H_{13}$, confirming this as nido kind. The structure of some of the possible isomers that can be obtained experimentally are given below.

Figure 21. Structure and isomerism in $C_2B_9H_{13}$.

2. $C_2B_4H_8$: In $C_2B_4H_8$, $n = 6$; according to Wade's rule, the two CH units contribute $2 \times 3 = 6$ electrons and three BH units contribute $4 \times 2 = 8$ electrons and two additional hydrogens contribute $2 \times 1 = 2$ electrons to the bonding molecular orbitals or the skeletal structure. Thus there are total 16 electrons or 8 electron pairs ($n+2 = 8$) present in the multicentre bonding orbitals of $C_2B_4H_8$, confirming this as a nido kind. The structure of some of the possible isomers that can be obtained experimentally are given below.

Figure 22. Structure and isomerism in $C_2B_4H_8$.

➤ **Arachno-(Weblike) Carboranes**

These are web-like geometries and can be assumed as the derivatives of closed triangular polyhedral structures in which two vertices are removed. Most of the sites in these clusters are occupied by boron atoms while some sites by carbons. There are $n+3$ electron pairs (or $4n+6$ skeletal electrons) involved in multicentre bonding in arachno-carboranes; where n represents the total number of B and C atoms. Some of the common examples of arachno-carboranes are:

1. $C_2B_6H_{12}$: In $C_2B_6H_{12}$, $n = 8$; according to Wade's rule, the two CH units contribute $2 \times 3 = 6$ electrons and six BH units contribute $6 \times 2 = 12$ electrons and four additional hydrogens contribute $4 \times 1 = 4$ electrons to the bonding molecular orbitals or the skeletal structure. Thus there are total 22 electrons or 11 electron pairs ($n+3 = 11$) present in the multicentre bonding orbitals of $C_2B_6H_{12}$, confirming this as an arachno kind. The structure of some of the possible isomers that can be obtained experimentally are given below.

Figure 23. Structure and isomerism in $C_2B_6H_{12}$.

2. $C_2B_7H_{13}$: In $C_2B_7H_{13}$, $n = 9$; according to Wade's rule, the two CH units contribute $2 \times 3 = 6$ electrons and seven BH units contribute $7 \times 2 = 14$ electrons and four additional hydrogens contribute $4 \times 1 = 4$ electrons to the bonding molecular orbitals or the skeletal structure. Thus there are total 24 electrons or 12 electron pairs ($n+3 = 12$) present in the multicentre bonding orbitals of $C_2B_7H_{13}$, confirming this as an arachno-kind. The structure of some the possible isomers that can be obtained experimentally are given below.

Figure 24. Structure and isomerism in $C_2B_7H_{13}$.

➤ **Structural Pattern Correlation Between Closo, Nido and Arachno Carboranes**

The structural pattern in closo, nido and arachno carboranes for different vertexes and skeletal electron pairs is very much important to to theoretical as well experimental analysis. Hs are omitted for clarity.

Figure 25. Continued on the next page...

Figure 25. Continued on the next page...

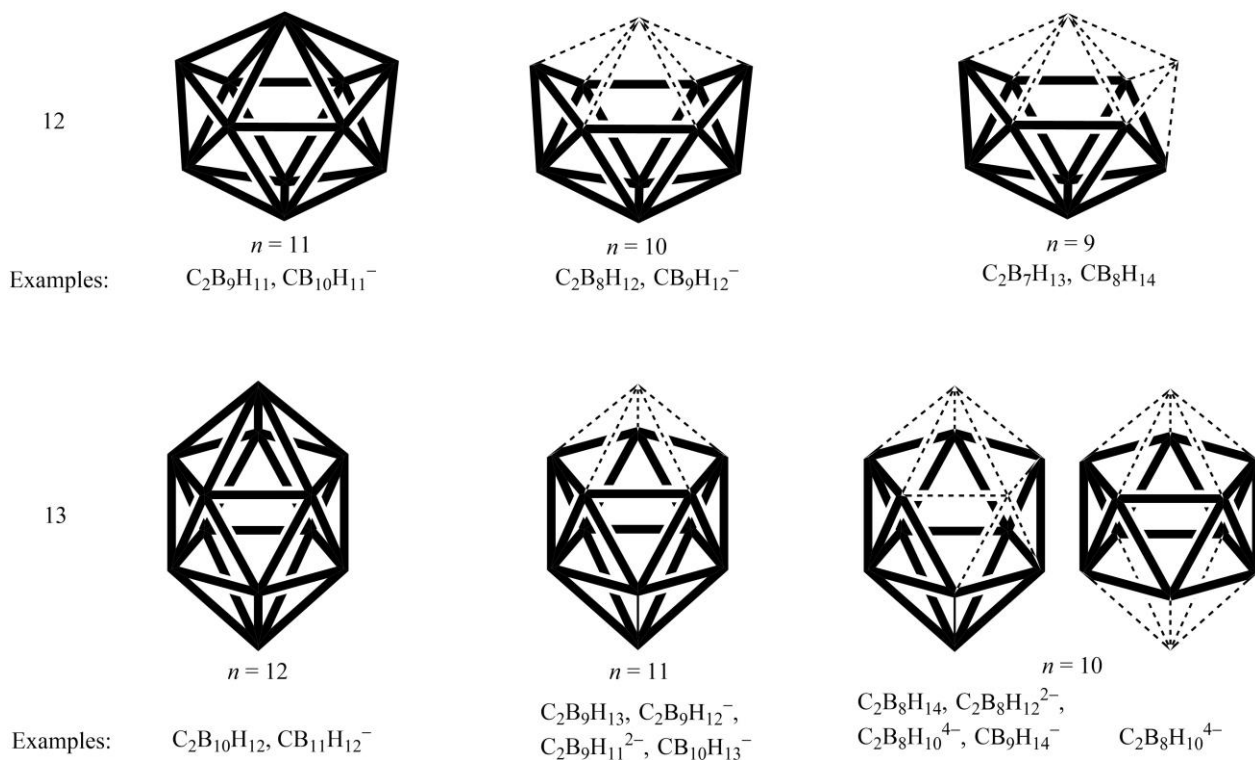

Figure 25. The structural relationship between closo, nido, and arachno carboranes.

Some hypoh-carboranes ($C_2B_{n-2}H_{n+6}$) also do exist in which three vertices from the parent deltahedron are missing. Furthermore, carboranes are also formed by joining two or more preceding types; called as conjuncto-carboranes.

International
Edition

A TEXTBOOK OF INORGANIC CHEMISTRY

Volume I

MANDEEP DALAL

First Edition

DALAL INSTITUTE

Table of Contents

CHAPTER 1	11
Stereochemistry and Bonding in Main Group Compounds:.....	11
❖ VSEPR Theory	11
❖ $d\pi-p\pi$ Bonds	23
❖ Bent Rule and Energetic of Hybridization.....	28
❖ Problems	42
❖ Bibliography	43
CHAPTER 2	44
Metal-Ligand Equilibria in Solution:.....	44
❖ Stepwise and Overall Formation Constants and Their Interactions	44
❖ Trends in Stepwise Constants.....	46
❖ Factors Affecting Stability of Metal Complexes with Reference to the Nature of Metal Ion and Ligand.....	49
❖ Chelate Effect and Its Thermodynamic Origin.....	56
❖ Determination of Binary Formation Constants by pH-metry and Spectrophotometry.....	63
❖ Problems	68
❖ Bibliography	69
CHAPTER 3	70
Reaction Mechanism of Transition Metal Complexes – I:.....	70
❖ Inert and Labile Complexes.....	70
❖ Mechanisms for Ligand Replacement Reactions	77
❖ Formation of Complexes from Aquo Ions.....	82
❖ Ligand Displacement Reactions in Octahedral Complexes- Acid Hydrolysis, Base Hydrolysis....	86
❖ Racemization of Tris Chelate Complexes	89
❖ Electrophilic Attack on Ligands	92
❖ Problems	94
❖ Bibliography	95

CHAPTER 4	96
Reaction Mechanism of Transition Metal Complexes – II:	96
❖ Mechanism of Ligand Displacement Reactions in Square Planar Complexes.....	96
❖ The Trans Effect.....	98
❖ Theories of Trans Effect.....	103
❖ Mechanism of Electron Transfer Reactions – Types; Outer Sphere Electron Transfer Mechanism and Inner Sphere Electron Transfer Mechanism.....	106
❖ Electron Exchange.....	117
❖ Problems.....	121
❖ Bibliography.....	122
CHAPTER 5	123
Isopoly and Heteropoly Acids and Salts:	123
❖ Isopoly and Heteropoly Acids and Salts of Mo and W: Structures of Isopoly and Heteropoly Anions.....	123
❖ Problems.....	152
❖ Bibliography.....	153
CHAPTER 6	154
Crystal Structures:	154
❖ Structures of Some Binary and Ternary Compounds Such as Fluorite, Antifluorite, Rutile, Antirutile, Cristobalite, Layer Lattices - CdI_2 , BiI_3 ; ReO_3 , Mn_2O_3 , Corundum, Pervoskite, Ilmenite and Calcite.....	154
❖ Problems.....	178
❖ Bibliography.....	179
CHAPTER 7	180
Metal-Ligand Bonding:	180
❖ Limitation of Crystal Field Theory.....	180
❖ Molecular Orbital Theory – Octahedral, Tetrahedral or Square Planar Complexes.....	184
❖ π -Bonding and Molecular Orbital Theory.....	198
❖ Problems.....	212
❖ Bibliography.....	213

CHAPTER 8	214
Electronic Spectra of Transition Metal Complexes:	214
❖ Spectroscopic Ground States	214
❖ Correlation and Spin-Orbit Coupling in Free Ions for 1st Series of Transition Metals.....	243
❖ Orgel and Tanabe-Sugano Diagrams for Transition Metal Complexes ($d^1 - d^9$ States).....	248
❖ Calculation of Dq , B and β Parameters	280
❖ Effect of Distortion on the d -Orbital Energy Levels	300
❖ Structural Evidence from Electronic Spectrum	307
❖ Jahn-Teller Effect	312
❖ Spectrochemical and Nephelauxetic Series	324
❖ Charge Transfer Spectra	328
❖ Electronic Spectra of Molecular Addition Compounds.....	336
❖ Problems	340
❖ Bibliography	341
CHAPTER 9	342
Magnetic Properties of Transition Metal Complexes:	342
❖ Elementary Theory of Magneto-Chemistry	342
❖ Guoy's Method for Determination of Magnetic Susceptibility	351
❖ Calculation of Magnetic Moments	354
❖ Magnetic Properties of Free Ions.....	359
❖ Orbital Contribution: Effect of Ligand-Field	362
❖ Application of Magneto-Chemistry in Structure Determination	370
❖ Magnetic Exchange Coupling and Spin State Cross Over	375
❖ Problems	384
❖ Bibliography	385
CHAPTER 10	386
Metal Clusters:	386
❖ Structure and Bonding in Higher Boranes.....	386
❖ Wade's Rules.....	401

❖ Carboranes	407
❖ Metal Carbonyl Clusters- Low Nuclearity Carbonyl Clusters.....	412
❖ Total Electron Count (TEC)	417
❖ Problems	424
❖ Bibliography	425
CHAPTER 11	426
Metal-II Complexes:	426
❖ Metal Carbonyls: Structure and Bonding	426
❖ Vibrational Spectra of Metal Carbonyls for Bonding and Structure Elucidation.....	439
❖ Important Reactions of Metal Carbonyls.....	446
❖ Preparation, Bonding, Structure and Important Reactions of Transition Metal Nitrosyl, Dinitrogen and Dioxygen Complexes.....	450
❖ Tertiary Phosphine as Ligand.....	463
❖ Problems	469
❖ Bibliography	470
INDEX.....	471

Mandeep Dalal

(M.Sc, Ph.D, CSIR UGC - NET JRF, IIT - GATE)

Founder & Director, Dalal Institute

Contact No: +91-9802825820

Homepage: www.mandeepdalal.com

E-Mail: dr.mandeep.dalal@gmail.com

Mandeep Dalal is an Indian research scholar who is primarily working in the field of Science and Philosophy. He received his Ph.D in Chemistry from Maharshi Dayanand University, Rohtak, in 2018. He is also the Founder and Director of "Dalal Institute", an India-based educational organization which is trying to revolutionize the mode of higher education in Chemistry across the globe. He has published more than 40 research papers in various international scientific journals, including mostly from Elsevier (USA), IOP (UK) and Springer (Netherlands) .
